Combination Chemotherapy With or Without Maintenance Sunitinib Malate (NSC 736511) For Untreated Extensive Stage Small Cell Lung Cancer: A Phase IB/Randomized Phase II Study

ClinicalTrial.gov Identifier: NCT00453154

Study Background

Trial Description

This partially randomized phase I/II trial studies the side effects and best dose of sunitinib malate and to see how well it works when given together with cisplatin or carboplatin and etoposide in treating patients with extensive-stage small cell lung cancer. Drugs used in chemotherapy, such as cisplatin, carboplatin, and etoposide, work in different ways to stop the growth of tumor cells, either by killing the cells or by stopping them from dividing. Sunitinib malate may stop the growth of tumor cells by blocking some of the enzymes needed for cell growth and by blocking blood flow to the tumor. It is not yet known whether cisplatin or carboplatin and etoposide are more effective when given with or without sunitinib malate in treating small cell lung cancer.

Arms:

Arm I (Combination Chemotherapy + Sunitinib Maintenance): (Experimental): Participants will receive the following combination chemotherapy for 4-6 cycles (21 days):

- Cisplatin 80 mg/m² by IV over 1 hour on day 1 every cycle OR Carboplatin AUC = 5* by IV Etoposide 100 mg/m² by IV over 1 hour on days 1, 2, and 3 every cycle
- Maintenance: Following 4-6 cycles of combination chemotherapy, start sunitinib at 150 mg on day 1, then 37.5 daily until disease progression.

Arm II (Combination Chemotherapy + Placebo Maintenance): (Active Comparator): Participants will receive the following combination chemotherapy for 4-6 cycles (21 days):

- Cisplatin 80 mg/m² by IV over 1 hour on day 1 every cycle OR Carboplatin AUC = 5* by IV Etoposide 100 mg/m² by IV over 1 hour on days 1, 2, and 3 every cycle
- Maintenance: Following 4-6 cycles of combination chemotherapy, start placebo at 150 mg on day 1, then 37.5 daily until disease progression.

Objectives:

PRIMARY OBJECTIVES:

1. To determine the phase II dose for sunitinib (sunitinib malate) combined with cisplatin

and etoposide. (Phase IB)

2. To compare the progression-free survival of patients with extensive stage small cell lung cancer treated with cisplatin or carboplatin and etoposide followed by maintenance sunitinib to patients receiving the same chemotherapy followed by placebo. (Phase II)

SECONDARY OBJECTIVES:

- I. To assess the single agent response rate for sunitinib given as monotherapy after chemotherapy. (Phase II)
- II. To assess the overall survival of patients treated with cisplatin or carboplatin and etoposide followed by sunitinib. (Phase II)
- III. To evaluate the toxicity and tolerability of maintenance sunitinib after cisplatin or carboplatin and etoposide. (Phase II)
- IV. To determine the association between vascular endothelial growth factor (VEGF) plasma levels and tumor response. (Phase II)

Dataset Information:

Dataset Name: NCT00453154-D1-Dataset.csv (ae)

Description: Dataset NCT00453154-D1-Dataset.csv (ae) is one of 2 datasets associated with PubMed ID 25732163. This dataset contains information for the adverse events reported in the manuscript.

Unless indicated, missing values indicate the data was not collected.

Data can be used to approximate published study findings, but exact reproduction of previous manuscripts may not be possible in some cases (e.g., when data must be modified for de-identification purposes or have undergone further data cleaning).
